

Clinical implications

Coagulation factor II (prothrombin) is a glycoprotein involved in the process of blood coagulation. Prothrombin is converted to thrombin, which cleaves fibrinogen to fibrin monomers (necessary for blood coagulation). G20210A mutation is located in the prothrombin gene promoter region and causes prothrombin over-activation which leads to increased risk of blood clot creation.

Principle of detection

The kit is intended for detection of mutation G20210A in coagulation factor II in human genomic DNA. Detection is based on **real-time polymerase chain reaction (qPCR) using fluorescently labelled probes (allelic discrimination)**.
