

## Modified oligonucleotides

Besides unmodified oligonucleotides, we synthesize oligonucleotides containing modifications. The most common modifications are those at the ends of the chain – at 3' or 5' or combined.

There are many other possibilities of modifications: A modifying molecule can be inserted into the chain; nucleotides in the chain can be replaced by their analogues; spacers of various kinds and lengths as well as functional groups or molecules

can be inserted into the sequence of the oligonucleotide. Phosphodiester bonds can be modified as well, at all sites of the chain or selectively.

We recommend that you consult us regarding less common modifications or their combinations prior to their ordering as many limitations of synthesis or purification of final product may occur.

## Fluorophores

Fluorophore	5'	internal	3'
6'FAM	1108	x	1138
